# Mobile App for a Gourmet Sandwich Shop (GSS)

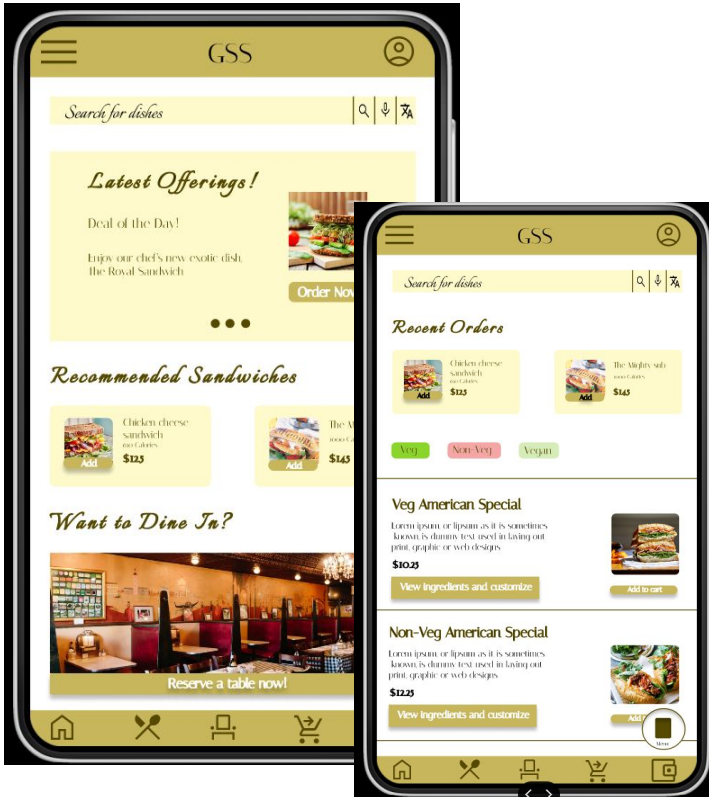

Niharika Dinesh

Google

# Project overview

## The product:

We're creating a mobile app for our Gourmet Sandwich Shop to attract and retain customers in our online system. We need to launch our own mobile app to keep up with the competition. We target customers residing in metropolitan and suburban areas who order/dine out at least once a week, age group 21 and 80 and the diversity of customers including a fair distribution of genders and people of varying abilities

## Project duration:

March 2023- June 2023

# Project overview

## The problem:

Workers and commuters who are busy and health conscious lack the time to prepare a meal.

## The goal:

GSS aims to design an app with features like quick customizable meal preparation and a simple user interface are essential for busy people. We also focus on providing healthy and exotic meal options.

Google

# Project overview

## My role:

UX designer designing an app for GSS from conception to delivery.

## Responsibilities:

Conducting interviews, paper and digital wireframing, low and high-fidelity prototyping, conducting usability studies, accounting for accessibility, and iterating on designs.

# Understanding the user

- User research
- Personas
- Problem statements
- User journey maps

# User research: summary

The first step in understanding the users was to conduct interviews and create empathy maps to understand their needs and pain points. A primary user group identified through research was adults who were health conscious, a desire to explore exotic meals and don't have time to cook meals.

Our research goal was to determine which specific challenges users encounter when they try to use our app to order food, reserve a table, track live delivery status and navigate the app itself. This in turn would increase user engagement and loyalty, such as offering discounts or rewards, and enabling customers to save their favorite order.

Google

# User research: pain points

1

## Time

Working Adults who are busy, lack the time to prepare a meal

2

## Lack of healthy meal options

Working Adults who are health conscious, need to watch out what they eat, helping them to choose wisely

3

## Accessibility

Online platforms could be made more accessible for people by incorporating assistive technologies like voice recognition, translation etc

4

## Delayed delivery

Working adults worry about delayed food delivery resulting in them being late for work

Google

# Persona: **Shridhar**

**Problem statement:**

Shridhar is a product manager with tight schedule managing a large team

who needs to have a healthy yet exotic meal in time because he has little to no time to cook a meal and has to watch his diet.

**Shridhar**

**Age:** 44
**Education:** MBA Degree
**Hometown:** Mumbai, India
**Family:** Lives with wife and 2 children
**Occupation:** Product Manager

*"I prefer a home-cooked meal, however gourmet food is a close second best "*

**Goals**

- To bring in creative ideas to the table for the clients
- To lead a healthy life style
- To minimize the household chores so they can spend quality time with their family

**Frustrations**

- "I don't have to worry much about home-cooked meal as I now what goes in it. When it comes to outside food, I worry about the ingredients and how much of them are used to prepare the meal"
- "I leave home without having breakfast due to Early meetings with my clients hence ordering in from a healthy and high quality food place for a quick bite becomes a priority"
- " Sometimes my kids can get stubborn about not wanting home-cooked meal. It becomes important as a parent to choose a healthy yet delicious meal for them

Shridhar is a product manager with a tight schedule managing a large team and constantly meeting up with his clients. He has a family history of diabetes and hence would like an app which specifies the calories and energy intake from the meal he is going to order to keep his health in check. Thus helping them to watch what they eat while enjoying a high quality, delicious meal. This will also help him to choose a better meal for the lifestyle he's living in.

Google

# User journey map

As a result of mapping Shridhar's user journey, it became evident that a dedicated GSS app would be beneficial to users.

**Persona: Shridhar**

Goal: Healthy and exotic food options at a reasonable price and quick delivery

| ACTION | Install the App | Become a Member | Browse the Menu | Place Order | Doorstep Delivery |
|---|---|---|---|---|---|
| TASK LIST | Tasks<br><br>A. Search for a dedicated food delivery app<br>B. Select an app and check its ratings and reviews<br>C. Install the app | Tasks<br><br>A. Sign up to become an exclusive member of the restaurant<br>B. Avail the benefits of this membership | Tasks<br><br>A. Browse the menu in food section<br>B. Filter out meals based on user preferences<br>C. Check out the nutrients/energy chart for each meal | Tasks<br><br>A. Add items to the cart<br>B. Confirm location<br>C. Place order by choosing any of the available payment modes | Tasks<br><br>A. Track delivery status<br>B. Contact delivery partner to confirm correct location where food needs to be delivered<br>C. Receive the package<br>D. Enjoy the meal |
| EMOTIONS | Confused by so many options for dedicated food apps<br><br>Happy to have found an app with high ratings and great reviews about the service | Thrilled to see exciting offers and discounts | Happy to see good deal of healthy and exotic gourmet food options<br><br>Annoyed because not all available food items have a visual representation | Anxious about the order getting delayed/ cancelled | Satisfied with on-time delivery service<br><br>Uncertain if order will reach on-time due to traffic/bad weather conditions |
| IMPROVEMENT OPPORTUNITIES | Advertise the food app on all social media so the users can find it easily | Offer table reservation to dine in the restaurant along with pre-order system using the app for its exclusive members | Include images for all meals available<br><br>Incorporate speech to text recognition to provide faster results on what users are looking for | Provide confirmation on the order at each and every step of the process | Give live updates on delivery to keep users in loop in case delivery partners are running late due to unexpected events |

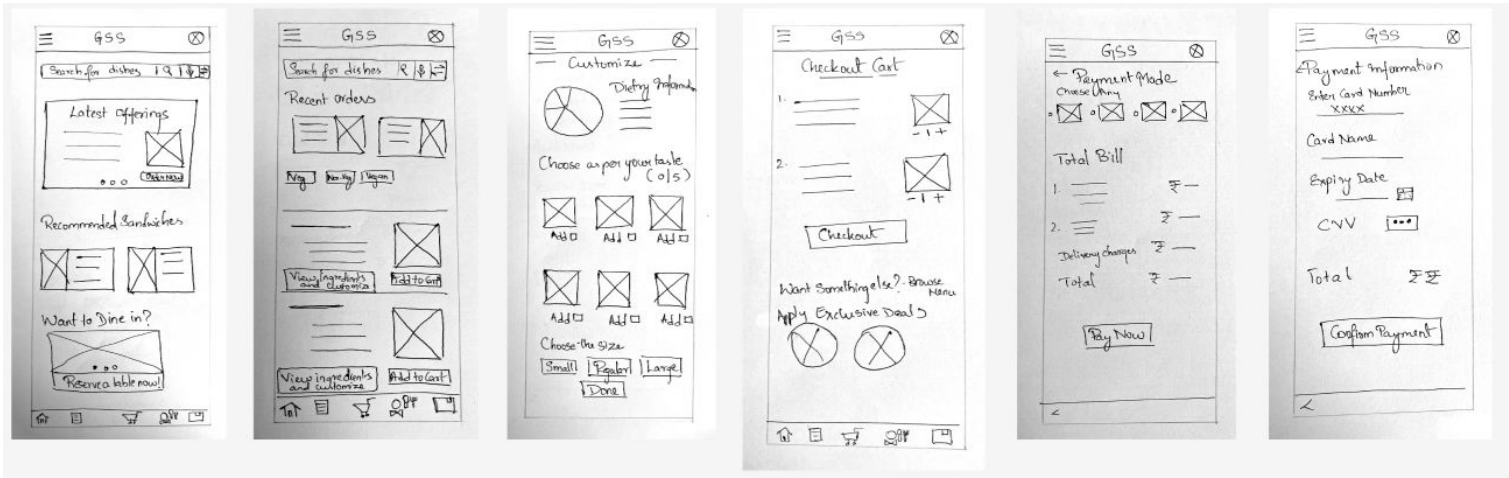

Google

# Starting the design

- Paper wireframes
- Digital wireframes
- Low-fidelity prototype
- Usability studies

# Paper wireframes

Paper wireframes were created initially for **Home** screen, Browse **Menu**, Dietary info and **Customize** screen, **Checkout** cart and **Payment** process screens.

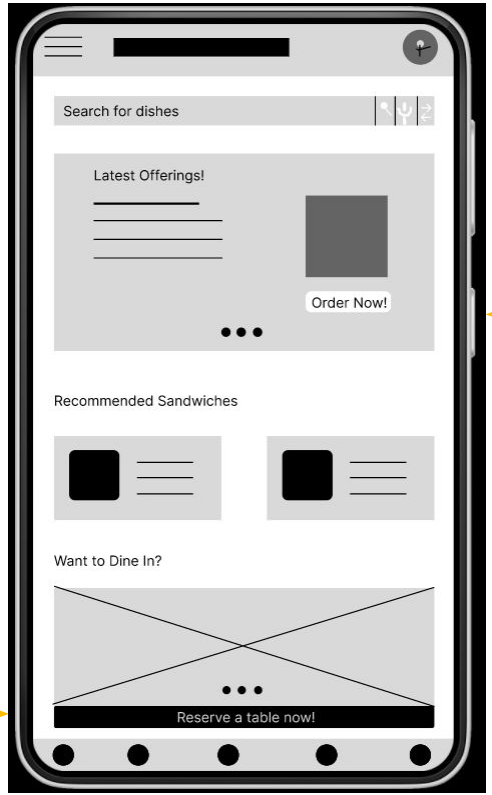

Google

# Digital wireframes

Throughout the initial design phase, I adapted screen designs based on user research and feedback.

Home Screen

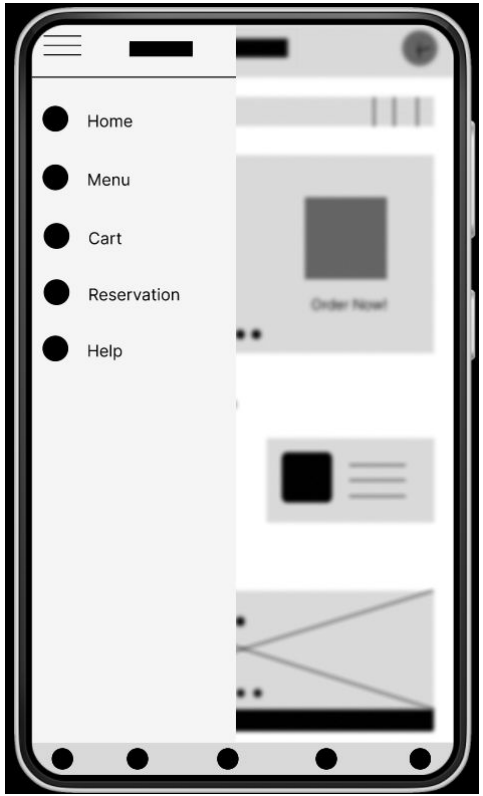

Order Now button in the latest offerings will directly add the meal to cart, skipping the part of browsing menu

Easy navigation to Reservation Screen by simply clicking on this button

Google

# Digital wireframes

Easy navigation to all the main screens available on the app

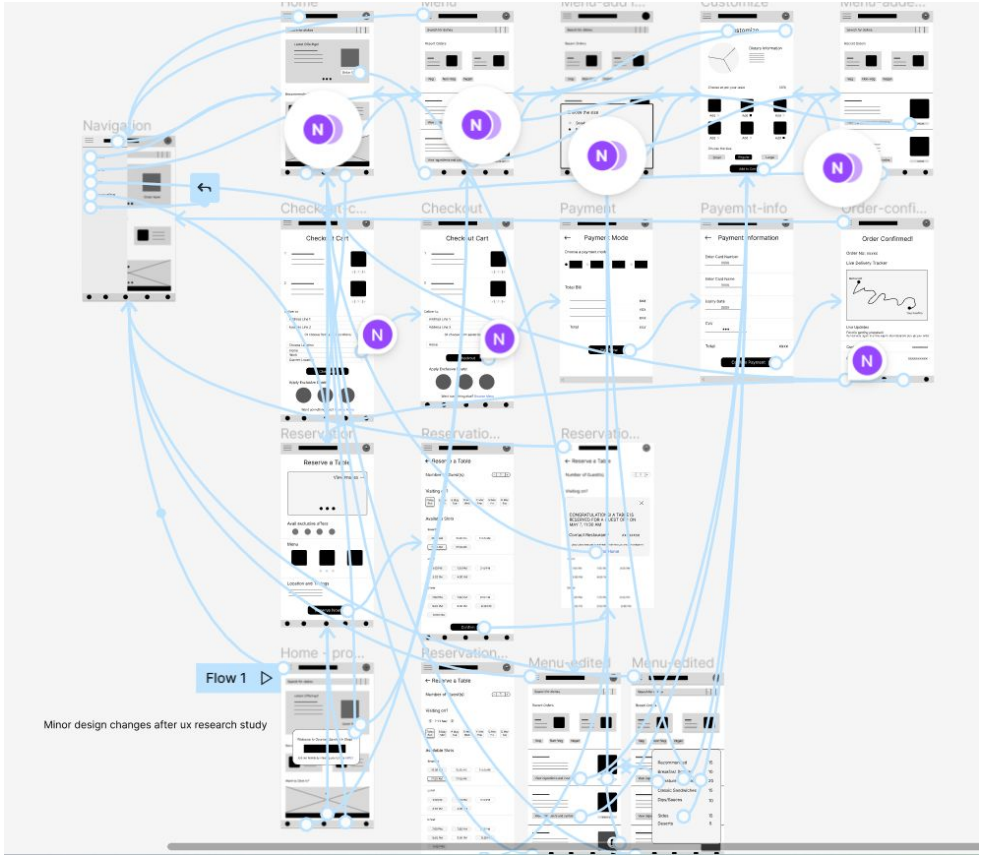

Easy navigation was a way to design user friendly app with more graphics included instead of texts which is slow to catch user's eyes

Google

# Low-fidelity prototype

Using the completed set of digital wireframes, a low-fidelity prototype was created. The primary user flow is from home screen to menu and choosing a meal from there to customize or directly add to cart. Then the user gets to checkout with a simple payment flow. The user can also reserve a table in reservation flow.

View the GSS low fidelity prototype here: [GSS-low-fi-prototype]

# Usability study: findings

I conducted two rounds of usability studies. Findings from the first study helped guide the designs from wireframes to mockups. The second study used a high-fidelity prototype and revealed what aspects of the mockups needed refining.

## Round 1 findings

1. Pop-ups wherever necessary
2. Customize the order quickly
3. Extended dates for table reservation

## Round 2 findings

1. More customization options
2. An organized and easy to access menu

Google

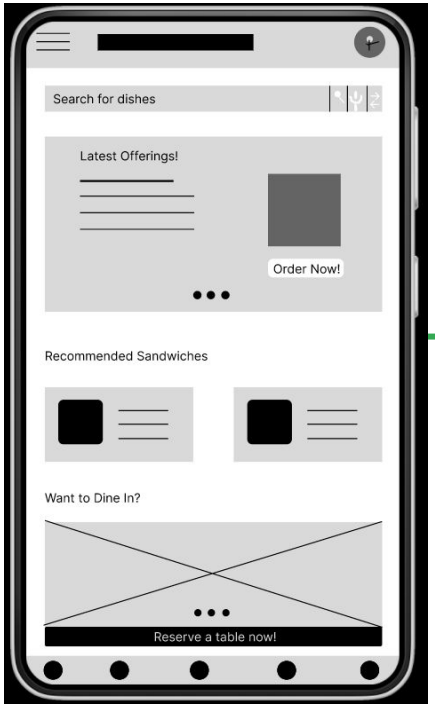

# Refining the design

- Mockups
- High-fidelity prototype
- Accessibility

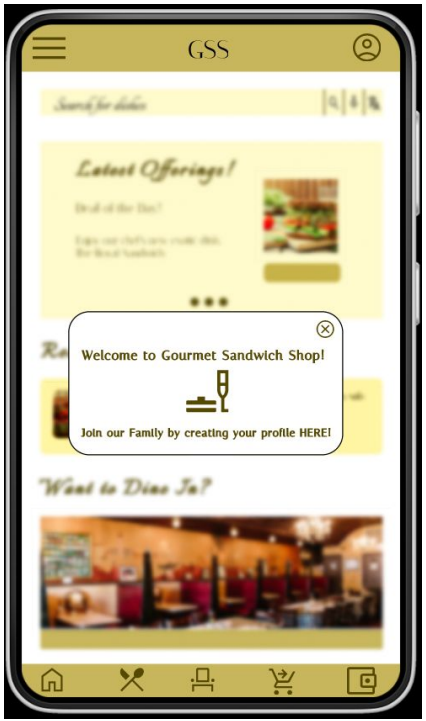

# Mockups

Profile icon was difficult to find for few of the new users A prompt window has been added in the Home Page so new users can easily navigate to Profile Page and create one

Before usability study

After usability study

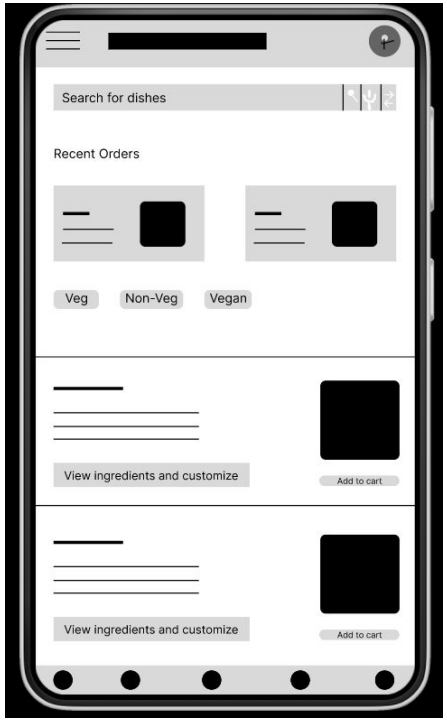

Google

# Mockups

For most users, it was difficult to choose a meal of their choice from a long list of options in the menu page A category icon is added which contains different categories of sandwiches available, on selecting any category it will filter out the items rather than displaying a flat list of all available sandwiches.

Before usability study

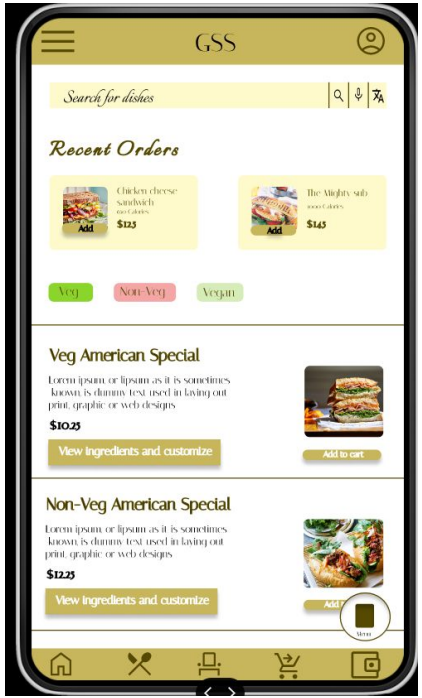

After usability study

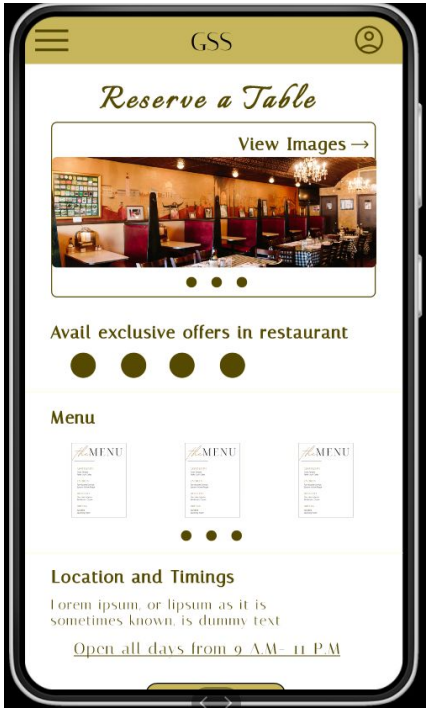

Google

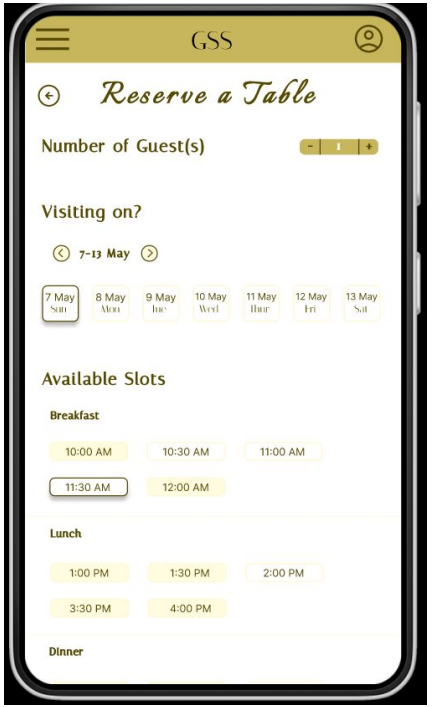

# Mockups

Google

# High-fidelity prototype

The final high-fidelity prototype presented cleaner user flows for customizing sandwich and checkout. It also met user needs for more quick customization of sandwich, organized menu card and extended display of dates for table reservation on the app

View the GSS:

[GSS-Hi-Fi-Prototype]

# Accessibility considerations

1

Provided access to users who are visually impaired through adding voice recognition

2

Usage of graphics and icons for faster and easier navigation

3

Provided access to users who have language barriers by enabling language translation (5 languages supported)

Google

# Going forward

- Takeaways
- Next steps

# Takeaways

## Impact:

GSS truly considers the needs of its users when designing this app.

One quote from peer feedback:

*"I should say, this app is impressive. I always gotta watch my diet and not always i get to know what I am consuming. The visual representation of dietary info is really useful. I can also choose what I want in my sandwich! I highly recommend this app if you're in search of meals that are exotic yet healthy available at a reasonable price!"*

## What I learned:

I was able to refine the design based on user feedback and create an app that was both intuitive and user-friendly. This process taught me that design is an iterative process and that it's important to take feedback from users into account

Google

# Next steps

1

Ensure that the pain points users experienced are effectively addressed by conducting another round of usability studies.

2

Test the app with a larger group of users to ensure the design changes are successful.

3

Gather insights on how users interact with the app to determine areas of improvement.

Google

# Let’s connect!

Thank you for your time reviewing my work on the GSS app! If you’d like to see more or get in touch, my contact information is provided below.
